

GitHub step-by-step guide

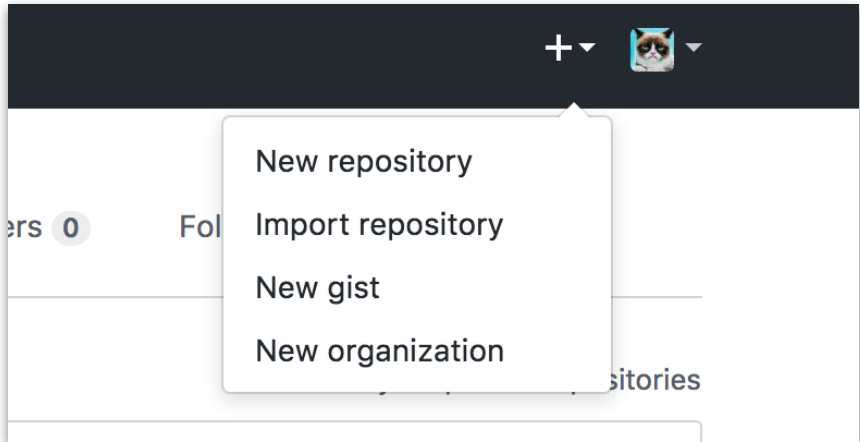

How to create a new repo on the cloud and clone it to your machine

1. Create an account on GitHub.com

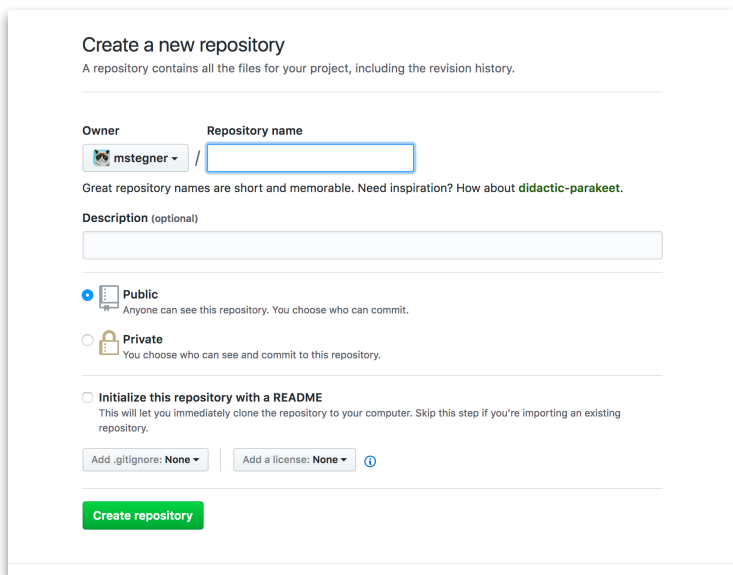

super important!
choose a profile photo
very carefully!

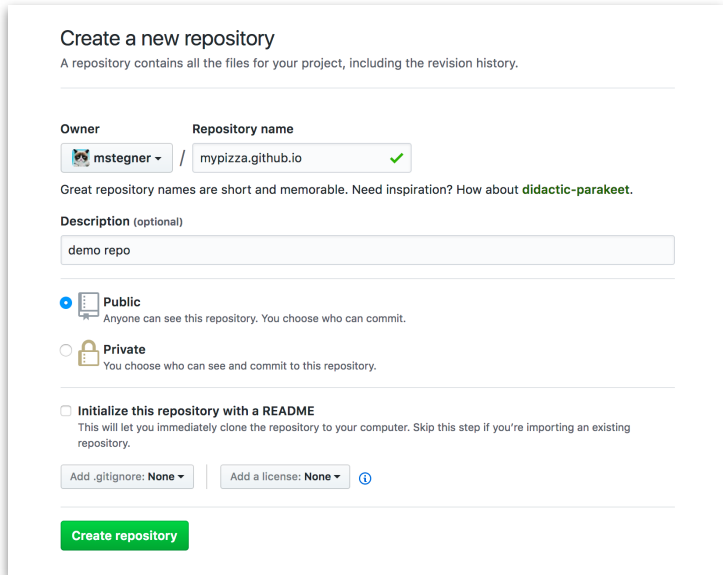

2. Click on + dropdown menu, and select "New repository"

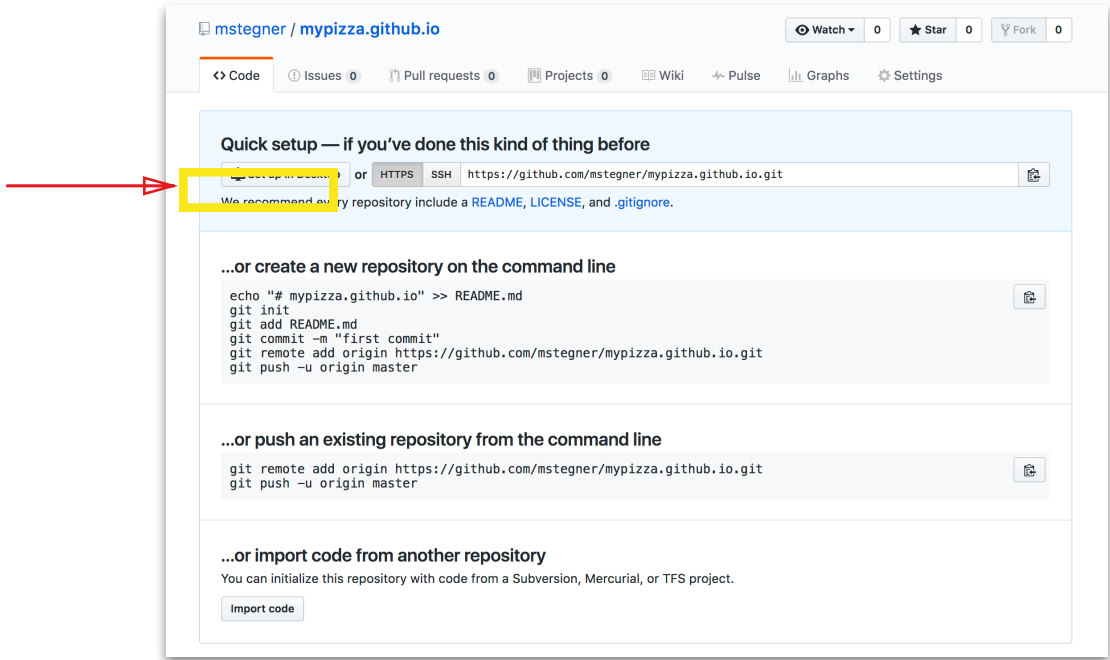

3. Give your new repo a name that matches this format: username.github.io

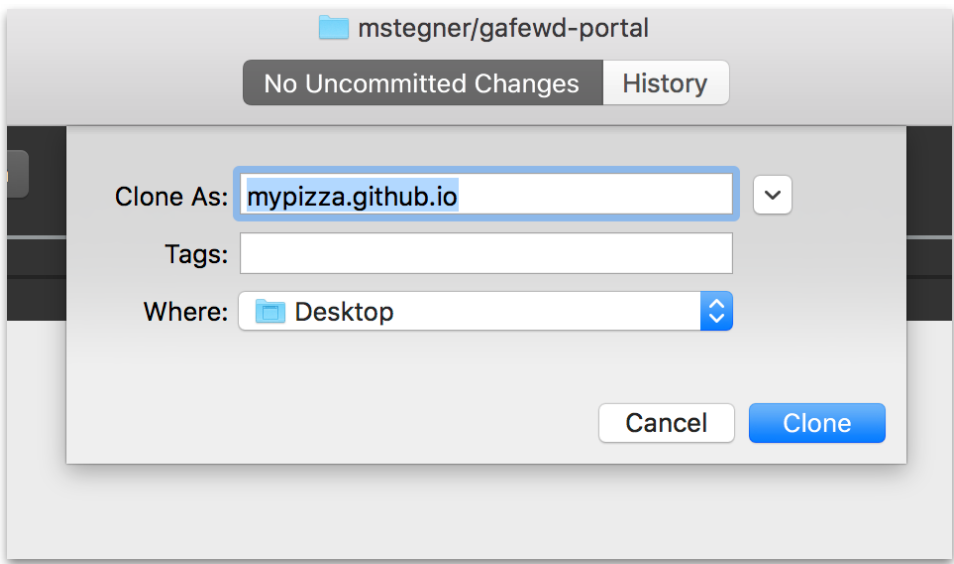

4. After you name your repo, click on green "create repository" button

5. Under "Quick setup", click on button "Set up in Desktop"

6. This dialog box should open in GitHub Desktop, prompting you to choose a location for your local repo. I like to keep mine on my desktop for easy access, but it doesn't matter where you store it as long as you know where it lives. Click on blue "Clone" button

7. You should see a folder with your repo name created on your computer. This is where all your files will be stored.
