

GitHub step-by-step guide

Commit and publish your files to the cloud

1. Write your code, and save your file(s) in Sublime Text

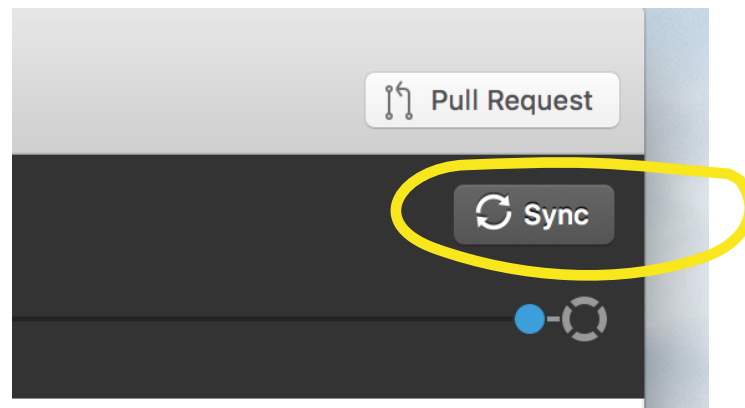

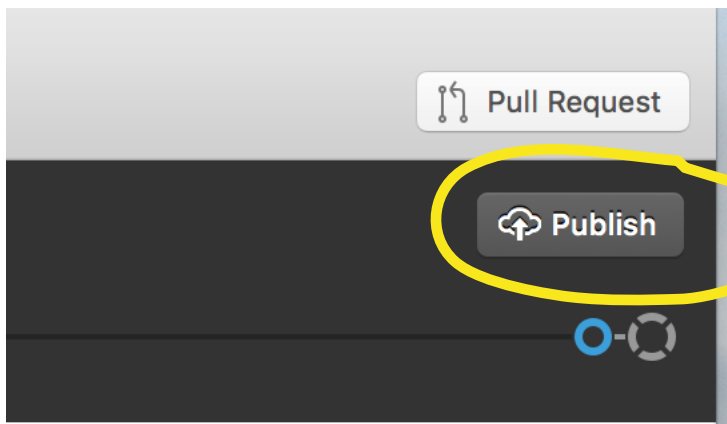

2. In GitHub desktop, when you highlight your repo name in the sidebar (mypizza.github.io), you'll see there are 2 Uncommitted Changes detected by the program, and it will show you which files were changed (in this case index.html, and styles.css)

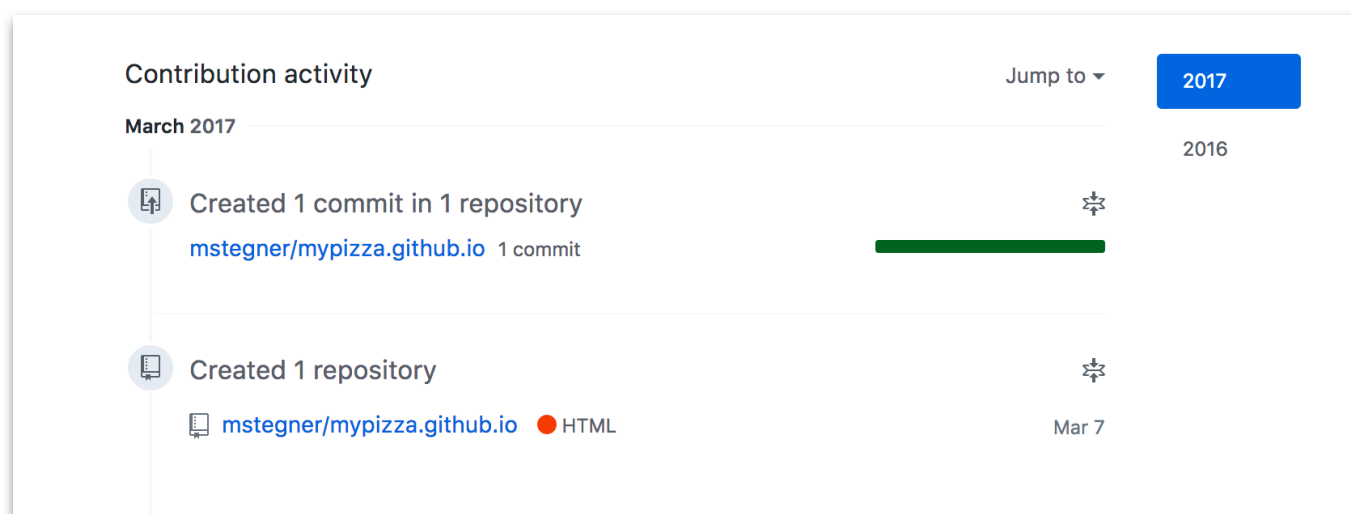

3. Fill out a brief Summary, then click on "Commit to master" button

4. Click on "Publish" or "Sync" button to synchronize your local repo with your repo in the cloud. You only get the "publish" option the first time you push a new repo up to the cloud, and the rest of the times you will get the "sync" button

5. In Chrome, visit your repo on GitHub.com, refresh the page, and you will see in your contribution activity that you made a new repo and a new commit

6. Click on the repo name to see more details and a history of commits
